

1. AI Tool(s) Used

- Gemini
- Claude

2. Scope of Usage

For most of the project, I wrote a little bit of the code by myself to set up the basic logic, and then asked the AI to refactor and complete it.

A. Firebase Auth and Database

Location: js/auth.js, js/chat.js

Prompt: "I wrote some basic login and database functions. Can you refactor them to use the Firebase compat SDK correctly?"

Response: AI refactored my functions and added the proper onSnapshot listeners for real-time updates.

Refinement: I modified the returned code to make sure the blocked users logic worked correctly with my UI.

B. Chatroom UI and Flexbox

Location: style.css, index.html

Prompt: "I have some basic HTML for the chatroom. Help me write the CSS using flexbox so it doesn't overflow."

Response: AI provided the CSS flexbox rules like min-height: 0 and overflow-y: auto.

Refinement: I applied these classes to my HTML elements.

C. Gemini Bot

Location: js/chat.js

Prompt: "Here is my fetch request. Refactor it to correctly call the Gemini API."

Response: AI corrected my JSON payload structure and endpoint URL.

Refinement: I integrated it so it only triggers when someone types "@bot".

D. Canvas Sticker

Location: js/ui.js

Prompt: "I wrote a basic canvas setup. Help me refactor it to support drawing with different colors and brushes."

Response: AI refactored my canvas event listeners.

Refinement: I added the undo history feature.

3. Statement of Non-Usage

For the rest of the code, I wrote a little bit of the base structures by myself, and asked the AI to refactor and optimize it.
